

Our SAP BusinessObjects Services

→ All information, all people, one single platform

Today, if we talk about reporting, we want to concentrate on all enterprise data, we need to reach all people within the company and use one single platform.

Intensum has a long tradition in business reporting and has solid experience in the construction and deployment of flexible and efficient data warehouses. We also master a wide range of user-friendly and intuitive reporting tools in order to cover the various user segments...

In the SAP Business Intelligence Platform (BIP) we distinguish several components : The BusinessObjects layer which addresses the reporting tools, the NetWeaver Business Warehouse as data-warehouse, and the Data Services to ensure fast integration & quality of data.

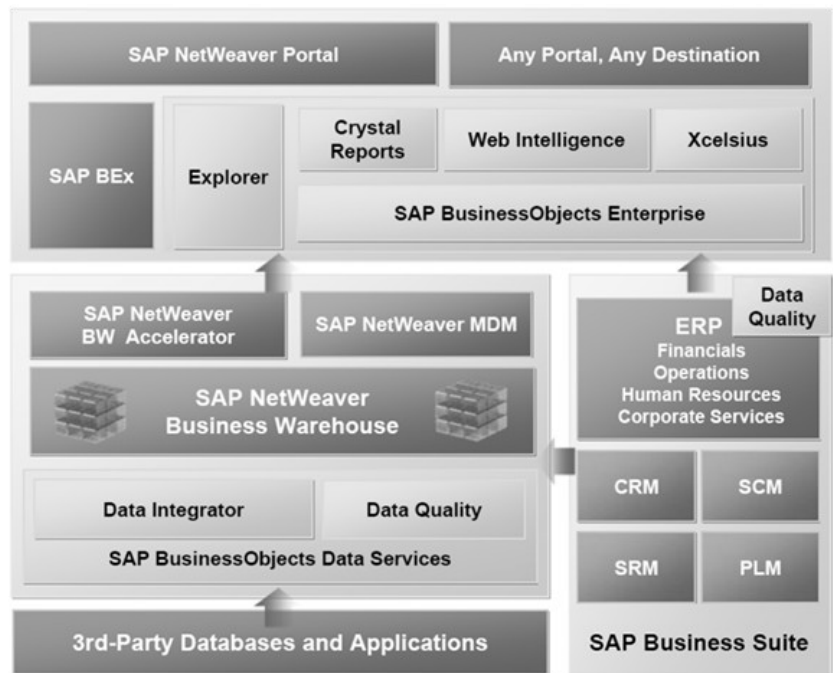

At Intensum, we are convinced we are well positioned to support our customers in this new portfolio of solutions and tools : not only we do have a long tradition with SAP Business Warehouse as warehousing solution, we also have senior Business Objects experts on board to guide our customer towards the next generation user experience.

Even more, we have built up a solid experience on major projects using the front-end tools from Business Objects on top of existing SAP Business Warehouses, combining multiple data sources such as SAP ERP, Oracle databases, CRM, flat files, etc. offering the same intuitive look and feel in terms of reporting and dashboarding.

Mastering the new SAP BusinessObjects reporting tools is one aspect, but we're also proud of our leading position in terms of business planning and our excellent competencies on the functional side...

We guide our customers from A to Z in a reporting project :

- Setting up a reporting strategy throughout the company,
- Analyzing the reporting requirements and proposing the right reporting tools to the right people,
- Modeling and building the data model to integrate multiple sources of data,
- Optimizing the information distribution : from online ad-hoc reporting to broadcasting and portal publishing,
- Development of the queries and reports,
- User training,
- Performance assessment, maintenance and upgrade services.

The new SAP Business Intelligence Platform (BIP) holds many tools and services to ensure both uniform, intuitive and powerful reporting, as well as a solid data foundation using SAP NetWeaver Business Warehouse and Data Services. From a data perspective, we now have the capabilities to integrate different sources of information without having to construct one data-warehouse containing all information. Such projects are very time-consuming and often doomed to fail due to technical constraints.

With the new platform we can ensure data integrity and quality and build reports directly on top of different sources of information :

- SAP NetWeaver Business Warehouse
- Any ERP
- Databases like Oracle, MS SQL, Sybase, etc...
- CRM systems
- Flat files

From a reporting perspective, we now dispose of many different tools, each of them focusing on different areas and people within your company :

- SAP Business Explorer (Bex) for OLAP analysis and drill-down
- Web Intelligence for ad-hoc reporting
- Xcelsius for dashboarding and visualization
- Crystal Reports for formatted reporting
- Explorer for fast discovery of relationships and root causes in large data sets

The reporting tools of SAP BusinessObjects also offer excellent export capabilities towards PDF or MS PowerPoint. Using Live Office it is also possible to integrate enterprise data in the MS Office applications such as Word, Excel, Outlook and PowerPoint. These features lower the entry to access enterprise data and ensure that all people use the same data for their specific reporting. More over it offers new ways to distribute data to different user segments. Get rid of taking screenshots of reports to integrate them into your slides – this can now be done with one mouse-click and even be further automated via the broadcasting services...

Last but not least, at Intensum, we also have great functional people allowing us to bridge the gap between business and IT. We dispose of reporting references in many functional areas such as :

- Finance, controlling and treasury
- CRM, Sales & Marketing
- Human resources
- Management & CxO dashboards
- Manufacturing and supply chain

Please do contact us if you need more information on our services and references regarding BusinessObjects and SAP Business Warehouse.

Our people will be glad to help you in the analysis of your reporting needs or to give your existing data-warehouse just that **extra boost of credibility** and user-friendliness it requires...
